

Secure Cloud Email

FireEye Email Security + Microsoft Office 365

FireEye Email Security

- Reduces the risk of significant business impacts caused by email-based malware, URL, impersonation and multi-stage attacks
- Evolves as quickly as the changing threat landscape to stay one step ahead of attackers
- Provides a higher detection rate by applying contextual threat intelligence

The increase in transitions to cloud-based environments make it a crucial time to enhance your email security as you move from on-premises Microsoft Exchange to Office 365. Email-based advanced threats have evolved with impersonation and URL-based attacks becoming more popular. Office 365 may include advanced threat protection, but testing shows that it lacks the functionality needed to detect many of today's targeted threats. An email defense must adapt quickly to a dynamic threat landscape.

FireEye Email Security goes beyond Microsoft security add-ons by providing a comprehensive stack for advanced threat protection against attachment, URL and imposter-based attacks. Integrated antivirus and anti-spam (AVAS) protection consolidates your email security and reduces the number of vendors in the email stack. FireEye Email Security combined with Office 365 and Exchange Online delivers highly effective email protection with ease of deployment.

Today's high-impact email threats are not delivered in annoying spam messages. Instead, they hide in carefully designed spear-phishing campaigns and targeted attacks. End users click on seemingly harmless email messages that can download malicious malware, steal credentials and lead to fraudulent wire transfers. These sophisticated email attacks make it easy for cyber criminals to breach your organization, putting corporate and customer assets at risk.

FireEye is recognized by security, IT and business professionals around the globe as the leader in cyber security. We have identified more zero-day attacks than all other security companies combined. Our threat intelligence is fueled by the most powerful cyber defense ecosystem in the world, correlating data from over 200,000 incident response hours, 16 million sensors deployed globally, 50 thousand indicators published per month and 10 million tracked threat personas.
