

Are you connected?

Network deployments have significantly changed over the past decade. Organizations are embracing mobile and multicloud, as well as IoT and edge computing, leading to gaps in your security defense. Not good news when...

Threats are getting more advanced, increasing the pressure to keep pace.

Threats are growing in number and frequency, and human security teams are trying to defend against everything.

Enterprises can't recruit enough people to maintain sufficient security standards.

Modern security must keep up. A number of highly effective security technologies are available today, but having too many tools and solutions, many of which are siloed, is becoming harder to manage.

An organization in maintenance mode will struggle to keep up with the constant barrage of evolving, complex attacks. That organization is better served by a strategy that makes security a priority, aims to stay a step ahead of the threats, and turns cyber protection into a business advantage.

With Juniper Connected Security, you can see the threats you must respond to, identify high priority threats and provide automated protection.

See what's happening

Identify who and what is on the network in real-time through deep, network-layer visibility and insight into threat activity.

Automate security coverage

Seamless integration with networking devices and third-party security tools ensures consistent policy and enables dynamic network adaption to protect against new attacks.

Protect your organization

Co-ordinated detection stops threats, from endpoint to edge and every cloud in-between.

By having a connected operating environment, with multiple points of enforcement throughout the network, you can effectively safeguard users, applications and infrastructure.

Extend security to all points of connection across your network. See, automate, and protect with Juniper Connected Security.
