

WINDOWS AUTOPILOT

ORCHESTRATED BY CDW

WINDOWS AUTOPILOT OVERVIEW

Windows Autopilot is a process used to set up and pre-configure new devices, getting them ready for your customers use. This solution can also be used to reset, repurpose and recover devices. Windows Autopilot is an all in one solution for organizational growth and turnover with little to no infrastructure to manage, and a process that's easy and simple. Get started now, with Microsoft Surface devices and Windows Autopilot.

KEY BENEFITS

- Autopilot allows you to configure and deploy your Windows 10 device over the Internet with no interaction from an administrator or IT staff.
- Configure your Microsoft Surface devices by automatically enrolling them in these solutions at their first bootup, right out of the box

WHY TO CONSIDER WINDOWS AUTOPILOT

IT pros spend a lot of time building and customizing images that will later be deployed to devices. Windows Autopilot introduces a new approach.

From the user's perspective, it only takes a few simple operations to make their device ready to use.

From the IT pro's perspective, the only interaction required from the end user is to connect to a network and to verify their credentials. Everything beyond that is automated.
