

Man AHL is a pioneer in the field of systematic quantitative investing. Its entire business is based on creating and executing computer models to make investment decisions. The firm has adopted the Pure FlashBlade™ solution from Pure Storage to deliver the massive storage throughput and scalability required to meet its most demanding simulation applications.

BUSINESS TRANSFORMATION

Quantitative researchers can run more simulations faster, accelerating time-to-market for new investment models and raising the probability of improved returns for investors.

“The greatest benefit for Man AHL from Pure FlashBlade is significantly improved productivity for the team and accelerated time-to-market.”

Gary Collier, Co-CTO

MAN AHL SELECTS PURE FLASHBLADE TO DRIVE INVESTMENT MODELING FOR ITS \$19 BILLION PORTFOLIO

Thirty years ago, stock markets around the globe suffered their greatest one-day losses ever. It’s also the year (1987) the investment management firm AHL (now Man AHL) was founded to deliver a revolutionary approach to hedge fund management.

Man AHL is a quantitative systematic investment manager, with more than \$19 billion in assets under management.¹ “Quantitative” means all of the firm’s investment decisions are based on mathematical models (algorithms); “systematic” means those decisions are made solely by computer, without human involvement.

Given this business model, Man AHL has attracted two extremely valuable sets of resources: the roughly 50 quantitative researchers (“quants”) who formulate the ideas driving the investment models, and the 60-plus technologists who both develop the quantitative research platform and turn those ideas into trading strategies that can be executed by computer.

One of the firm’s highest priorities is delivering a robust and ever-more-performant technology platform as a means of optimizing the performance and productivity of its quants and technologists.

“Our technology is key in giving the quants an environment in which they can explore and test their ideas, as well as a production environment that will faithfully implement the models they create,” said Gary Collier, Co-CTO at Man AHL in London. (Man AHL is part of Man Group, whose five investment management businesses manage over \$95 billion.²)

DEVELOPERS, ANALYSTS REQUIRE HIGHER-PERFORMING STORAGE

The demands on technology infrastructure at the firm are significant. “In the development of our trading models, we need to look at large amounts of data to run experiments and sift through all manner of possible ideas that might make money for our investors. Only those models in which we have sufficient conviction will then be put to work in the production trading environment,” Collier said.

COMPANY:

Man AHL
www.ahl.com

USE CASE:

- Applications – Bespoke quantitative trading strategies; application development using Python, Java and Apache Spark®
- Database – In-house development backed by Mongo®

CHALLENGES:

- Storage capacity was doubling every 18 months.
- Shared-storage architecture was not adequately supporting developers and quantitative researchers.
- Simulations required greater IOPS and bandwidth than legacy storage could provide.
- The business was unable to fully leverage new technologies such as Spark and AI.

TECHNOLOGY TRANSFORMATION:

- Up to 600,000 IOPS and 6GBs bandwidth provide more than sufficient processing power for the most demanding simulations.
- Quantitative researchers benefit from 10x-20x processing improvement.
- Highly scalable Pure FlashBlade™ architecture provides an on-demand path for future growth in capacity.

“A 10x-20x improvement in performance can be a game-changer when it comes to creating a time-to-market competitive advantage for us.”

Gary Collier, Co-CTO

In 2016, the technologists at Man AHL had concerns about the ability of its legacy mass-storage infrastructure to meet the demands of the quants and developers.

“We had an HPC (high-performance computing) environment with shared storage that supported all our research and software development activity,” noted James Blackburn, Head of Data Engineering at Man AHL. “At times, you would have people manipulating large numbers of files at the same time quants were trying to run large simulations. Our storage system just didn’t have the IOPS to support all those demands simultaneously, which meant some people would get frustrated by the response times. We needed something that would provide much greater IOPS and bandwidth.”

Collier noted, “We’ve had poor experiences in the past with expensive — and supposedly highly parallel — storage solutions simply not being able to deliver the bandwidth and IOPS we require. This time, we wanted to make sure we conducted extreme due-diligence to explore every possibility.” Blackburn was charged with managing the search for a new storage infrastructure.

In addition to high IOPS and bandwidth, “we also wanted the new storage to be highly scalable,” Collier added. “We’re an extremely agile business and need to be able to add terabytes of storage almost on a whim. We just want to be able to start where we are, then add capacity and IOPS as necessary. In other words, we want something that scales linearly.”

In addition, Collier noted, “We are not in the storage business, and do not want to dedicate multiple engineers to the job of building and maintaining bespoke storage solutions, or to administering complex-to-manage vendor products. That’s not what we’re best at, that’s not where the value-add from our technology lies.”

FLASHBLADE: PURPOSE-BUILT FOR MODERN ANALYTICS

Knowing that their need for high bandwidth and IOPS meant next-generation storage, the team investigated suppliers of all-flash products. “Pure Storage is very well-respected, both by organizations like Gartner and by users,” Collier said. “More often than not, if you Google a storage vendor’s name, you’ll find horrific stories about data loss and other problems. But the customers who have purchased and deployed Pure take the time to write Internet posts about their positive experiences. That was a good sign for us from the start.”

Based on its initial due diligence, the Man AHL team arranged for a proof-of-concept trial of a Pure FlashBlade system from Pure Storage. FlashBlade is the first all-flash storage system purpose-built for modern analytics — architected from the ground-up to deliver a powerful cloud-era data platform that is fast, compact, infinitely scalable and easy to manage. FlashBlade is designed for customers who need parallel storage to support data-intensive applications involving parallel processing, such as the type of financial simulations conducted by Man AHL.

Man AHL’s FlashBlade configuration has eight blades, each with 52TB raw capacity. Factoring in the overhead of the Purity OS and erasure coding, Man AHL is achieving 329.14 TiB of effective capacity thanks to an aggregate data reduction of 1.5:1 for all workloads running on FlashBlade.

“In the proof of concept phase, we pushed the Pure Storage system to the max,” Blackburn reported. “We tested total throughput for large I/O, maximum IOPS, and other metrics. Overall, the system scaled as promised. We achieved 6GBs bandwidth for large I/O reads and 3GBs for writes. And the 600,000 IOPS we achieved were far more than we ever had before.”

PERFORMANCE IMPROVEMENTS CREATE TIME-TO-MARKET ADVANTAGE

The impact of the new storage infrastructure was noticed immediately. “Many of our researchers have found that the introduction of FlashBlade has made it easier to use Spark for performing multiple simulations. One of them experienced a 10x-to-20x improvement in throughput for his Spark workloads compared to the previous storage system,” Blackburn said.

Added Collier: “Our quants want to test a model, get the results, and then test another one, and another one — all day long. So, a 10x-20x improvement in performance can be a game-changer when it comes to creating a time-to-market advantage for us.”

The greatest benefit from installing Pure FlashBlade, Collier said, “is significantly improved productivity for the team and accelerated time-to-market for new trading ideas.”

The POC involved workloads from across the firm’s research teams, “and we picked jobs that were very demanding on I/O, like our Jenkins builds and Spark users,” Blackburn said. “As we progressed, we loaded more and more concurrent workloads and did benchmark testing to see how close we were to the limits of the system. What we found is that FlashBlade gives us significant headroom beyond what we need for the business today. This gives us confidence knowing we can simply add a blade to gain more capacity, and preserve the investment we already have.”

A month into the POC, the firm’s entire research department had been migrated to FlashBlade. In addition, Man AHL runs a concurrent 50 TB Mongo database containing order-book data from stock exchanges and other sources. “During the POC, we put a replica set of the Mongo data on FlashBlade using an NFS mount. It worked so well that we left it there,” Collier said.

Beyond meeting the high-performance requirements of its core simulation applications, Blackburn said, “the real benefit of the FlashBlade is the consistent I/O and metadata access. To have a shared substrate of I/O that is consistent throughout the day makes users very happy. Storage used to be the bottleneck, and now that has been removed.”

EFFORTLESS MANAGEMENT AND A CLEAR PATH FOR THE FUTURE

Man AHL benefits from more than FlashBlade’s raw performance. “There are significant savings from the simplicity of operation. It just works,” Collier noted. “The fact that Pure Storage is plug-and-play adds to our operational efficiency. We’ve essentially cut our headcount for storage management from one-and-a-half to the equivalent of a half-time role. And going forward it’ll approach zero. That means we can redeploy those assets to higher-priority activities.”

Looking to the future, Collier said FlashBlade is a perfect fit for the firm’s growing — but at times unpredictable — storage and computing needs. “For a year we had been thinking about the challenges of shared NFS storage,” he recalled, “and FlashBlade came along at just the right time. FlashBlade is designed to scale out NFS, so it’s ideal for the kind of use cases we have. This includes simulations using Spark, where you are processing lots and lots of unstructured data and working with millions of files.”

“Having something as flexible and expandable as Pure FlashBlade is what our business demands.”

Gary Collier, Co-CTO

“Pure FlashBlade gives us significant headroom over what we need for the business today.”

James Blackburn,
Head of Data Engineering

“If we extrapolate the way we have been growing, we double our storage needs about every 18 months. And that’s a scary prospect. A Pure Storage competitor that we looked at required 4x the rack space of FlashBlade, without the ability to add capacity. In contrast, FlashBlade is very compact and scales easily just by adding blades. Having something as flexible and expandable as FlashBlade is what our business demands.”

Another attractive long-term benefit is Pure Storage support for the OpenStack initiative. “We are heavy users of Docker,” Collier said, “so we plan to take full advantage of OpenStack and Docker integration on the Pure data platform. That makes it very easy from a DevOps standpoint to create Docker volumes and attach them to containers.”

Above and beyond product satisfaction, the Man AHL team has benefitted from the extreme attentiveness of Pure Storage customer and technical support. As early as the POC, Blackburn said, “we saw how responsive the Pure team is. We had answers to questions generally within an hour of sending them, whereas we find other vendors can take weeks to respond. We’ve had astonishing turnaround from Pure.”
